Digestion

The purpose of this experiment was to find out which type of meat is harder to digest. The hypothesis of this experiment is that the inorganic meat will be harder to digest. First, form the two different types of meat and cook them separately. Then, separately grind each type of meat a little and put each in a separate beaker. Last, put each type of meat in a separate beaker and pour Hydrochloric acid onto each one and record the results over the period of one week. In conclusion, organic meat is harder to digest and may not be worth its price.
