Familial Predetermination

Familial Predetermination was designed to find a correlation between birth order and success. I surveyed over one thousand campers at Shady Grove Wi-Fi Campground. All of the campers were over the age of eighteen and my survey was anonymous and optional. My survey asked their age, gender, education, status, lifelong occupation, regrets, about their siblings, and much more. The campers were given a survey when they checked into the campground and were asked to put it into a box in the shower house when they were finished. My results were shocking. There was sixty-five only children, three hundred thirty-four first borns, two hundred eighty-eight second borns, one hundred fifty-six third borns, and one hundred fifty-six fourth borns and up. My results will allow the readers to learn from their words of what made them successful. They can compare themselves to the statistics according to their own birth order. They will grasp the campers' view of success and their own way of defining success. My survey will help people get onto the right track for success in life. It will be beneficial for anyone who comes upon my survey and its significant results.
