Affect Of Salinity On Plant Germination

My project was Affect of Salinity on Plant Germination. I hypothesized that increased salinity in the water would affect the growth of my onion and bean plants. Over a 7 day period I monitored the growth of the plants and watered them every 4th day. I gave them 20 milliliters of water per watering. In the end, my hypothesis turned out to be proven correct. The salted plants grew slower than the plants watered with tap water. If I would do my project again, I would use water and soil from a saline field to get results that were more realistic.
