Does Composition Put You Above The Competition?

I am testing different types of hockey sticks to see which one performs the best. I used three subjects and had them complete two tests. One for accuracy and one for speed. I had them shoot ten times in the accuracy test, and eleven times at the speed test. The purpose of this experiment is to find out if the more expensive stick gives you better performing results. I sat behind the net during both tests and charted the subjects' speed and accuracy.
