*Does It Exercise the Brain to Use the Alternate Hand?*

This experiment was to see if using the alternate hand would exercise the brain. I did this experiment by finding an IQ test for each individual to take and had them take it. The first thing I did was gather four people and have them test their IQ. Then, they drew a picture of a smiling sun with their alternate hand. Next, they retook the test to see if they would get a higher score. As a final step, their score was recorded and compared with the first score. As a result, everyone's score went up a little. Since their score went up, it shows that the hypothesis was correct.
