

Megan Wurst  
*Flower Power!*

The purpose of this project was to see if the caffeine and sugar in energy drinks can make a flower healthier than water can. I hypothesized that the flower with the water will grow better than the flowers with the energy drinks because the caffeine and sugar will overpower the flowers with the energy drinks. The experiment involved five flowers. Four were given energy drinks. One was given water. I gave them 100 ml. every other day and took pictures every day so I could compare them in the end. The data collected did support my hypothesis. There was too much sugar and caffeine in energy drinks for the plants to stay alive. These findings lead me to believe that water is better for you than energy drinks. Water can also keep you healthier than other drinks.
