

Jessalyn Bay-Voit
Bites?

The purpose of my project was to show people and owners' of pets what was is growing on their canine teeth. What I did in my project was I took one subject at a time and swabbed their tooth and I did that three times a day in the morning, afternoon, and evening with every subject. I found that cats had an average of 14 while dogs had 3 and humans had 8 in "Different Types of Colonies." I found cats had an average of 41 while dogs had 41 and humans 22 in "Diameter of colonies." I accepted that cat had the most dangerous bacteria because they had mold in their mouth. I rejected that humans were going to have the most types of bacteria. I also rejected that every Petri dish was going to have more than 10 different colonies in each Petri dish.
