*re Freshing*

In this experiment, I was attempting to make homemade water filters that are comparable to a Berkey Filter. My step-mom was the inspiration behind the idea. When brainstorming for science fair project ideas, we decided upon water filters. When I attempted my experiment, the homemade filters failed, yet it would be possible with more research. The experiment was fun and very interesting to learn about. This experiment taught me a lot about filters and how they can be used in life. Survival would be one example and possibly the most important one. We need water to survive and by knowing how to filter water, we have the possibility to do so.
