

Garrett Stegner
The Mushrooming Effect 2

My project this year was a continuation of last year's project. This year I used a 100 grain bullet instead of a 75 grain bullet. That makes a big difference than a 75 grain. It goes farther and faster and packs a bigger punch. The goal of this project is to let hunters and shooters buy the best kind of bullet for whatever purpose they need. I want them to know the difference between a 75 grain bullet and a 100 grain bullet. Also to let them know that if you have the biggest bullet you are not the best. Bullets are made of a reason and the grain is specific to the type of animal it is designed to hunt. My hypothesis was right in saying that the 100 grain bullet would not mushroom into the target as far as a 75 grain bullet would. The conclusion was very interesting.
